

Mid-Level Full-Stack Developer — DragonCandy

You would work the audit backlog, reviewed by our senior developer, and grow into owning part of the system.

Location: Europe is fine. Working hours 12:00–18:00 Central European (06:00–12:00 US Eastern).

Engagement: Paid two-week trial → 6-month contract → extend or convert to permanent. **Start:** Target Q4 2026, 30 days after the product manager and designer. **Reports to:** the Senior Developer.

The company

DragonCandy connects businesses with content creators. A restaurant gets a social media team without hiring one. A creator gets real paid partnerships instead of chasing gig apps. Our built-in AI, **Donny**, writes the campaigns, matches people, and schedules and publishes posts.

Live at dragoncandy.com, with an iPhone app already running on a real device. Pre-revenue by choice, about 30 organic users, no launch date set.

What you'd do

- Work through the audit backlog — real, defined tickets, not vague ones.
- Fix bugs across the whole product.
- Have every change reviewed by the senior developer, plus two automated AI reviews.
- Take ownership of one area of the system over time.

This is a job where you will be reviewed carefully and taught deliberately. If you want to be left alone to ship unsupervised, take the senior role or a different company.

What we need

Required

- **Solid React and TypeScript.** You are comfortable in a real codebase and you write types properly.
- **SQL you can defend.** You do not need deep PostgreSQL expertise on day one, but you must genuinely want to learn it — our security lives in the database, and you cannot avoid it here.
- **Care.** This product moves people's money. We would rather have someone careful and slower than someone fast and loose.
- **Fluency with AI coding assistants: Claude Code, Claude Cowork and OpenAI Codex.** Every branch is reviewed by Codex before a human may approve it. This is the pipeline, not a preference.
- Roughly **3+ years** building software.

Bonus

- Cursor
 - Supabase, Deno, Stripe, or Capacitor
 - Experience on a product real customers paid for
-

The first 90 days

Weeks 1–2 — paid trial. One real ticket, end to end, paid at full rate.

Month 1. Work the audit backlog. Learn the codebase by fixing it. Ship several small changes through the full pipeline.

Months 2–3. Take a subsystem. Start being the person who knows one area better than anyone except the senior developer.

How we work

- **Two-week cycles.** Monday planning, Friday demo.
 - **Linear** for tickets, synced with GitHub.
 - **Every change:** branch → pull request → automated checks (build, types, linting, 2,443 tests) → preview site → AI review → senior review → live.
 - **Written and asynchronous by default**, with about three hours of live overlap daily.
 - **Done means done:** merged, checked on phone and desktop, verified in production.
-

The stack

React 18 · TypeScript strict · Vite · Tailwind · shadcn/ui · Supabase (PostgreSQL, auth, storage, realtime) · 98 Deno edge functions · Stripe Connect · Anthropic Claude + OpenAI · Capacitor for iOS · Vercel.

No cloud infrastructure work — Supabase and Vercel run on AWS and we do not manage it.

Applying

Send a CV and something you built. Include your rate expectation in the first message, and confirm you can work 12:00–18:00 Central European time.
