DRAGONCANDY — CONFIDENTIAL

Social Media Integration Strategy

A complete architecture for bringing social posting, scheduling, analytics, and engagement inside DragonCandy — powered by Outstand.so and driven by Donny AI.

DATE

May 3, 2026

VERSION

1.0 — Approved Design

AUDIENCE

Leadership

STATUS

Ready for Implementation

For Joe, Juwan, and Dame: The Executive Summary and Sections 1–3 (Restaurant, Creator, Brand roles) give you the full picture. Implementation phases and success metrics are also worth a look.

You can skip the technical appendices at the end.

For the dev team: Everything above, plus the Appendices — API references, database schemas, and technical architecture details.

CONTENTS

1. Executive Summary
2. Platform Integration Architecture
3. Section 1: Restaurant Role
4. Section 2: Creator Role
5. Section 3: Brand Role
6. Campaign Lifecycle with Social Hooks
7. Section 4: Donny AI — The Social Media Brain
8. Section 5: How It's Built
9. Section 6: Implementation Phases
10. Section 7: Market Context (2026)
11. Section 8: Cost Governance Integration
12. Section 9: Success Metrics
13. Section 10: Guiding Principles
14. Appendices — Developer Reference

Executive Summary

DragonCandy connects restaurants, creators, and brands for content delivery 🎯🎯🎯 but right now, the social media posting that makes that content valuable happens entirely outside the platform. This integration closes the loop: content gets created, approved, *and published* inside DragonCandy, with Donny handling the posting so nobody has to leave the platform.

The Gap

A creator shoots a reel for Sakura Sushi. The restaurant approves it inside DragonCandy. Then — nothing. The restaurant downloads the file, opens Instagram, writes a caption from scratch, guesses at hashtags, posts manually, and loses track of performance. The creator does the same dance to post it to their own channels. The brand sponsor has no visibility at all. Three parties, three separate workflows, zero coordination, zero data flowing back.

The Solution

Outstand.so integration brings posting, scheduling, analytics, and engagement inside DragonCandy — and Donny AI reduces every social action to a single sentence: "Donny, post today's special to Instagram and Google Business."

Integration Partner: Outstand.so — a unified, developer-first social media API supporting 10 platforms through a single REST API. White-label ready, usage-based pricing (\$0.01/post after 1,000 included), and a 25-tool MCP server purpose-built for AI agent workflows like Donny.

Who Benefits and How

3

Roles benefit: Restaurant, Creator, Brand

10

Social platforms via one integration

25

MCP tools for Donny AI automation

- **Restaurants** get daily social media management without leaving DragonCandy — content calendar, Donny-driven posting, Google Business sync, and unified analytics that flows into their existing ROI Dashboard.
- **Creators** turn every campaign deliverable into personal brand content — Donny cross-posts with their voice, not the restaurant's, and their verified social metrics feed back into their DragonCandy profile to win more campaigns at higher rates.
- **Brands** sponsor one campaign and watch it amplify across three audiences simultaneously — with real-time performance data across all parties tracked in one dashboard.

DragonDash Rush Posting — The Premium Revenue Driver

The most expensive AI action in the social integration (multi-platform simultaneous posting with platform-specific captions) maps directly to DragonDash: a \$25–50 rush surcharge when a restaurant or brand wants content live everywhere the moment it's approved. High-cost features pay for themselves. The cost architecture is designed so that DragonDash actions generate revenue that more than covers the Sonnet-tier AI cost.

Core Decisions

Decision	Choice	Rationale
Feature Scope	Full suite (posting, scheduling, analytics, engagement)	Full picture so the team knows where we're headed, even though we build it in phases
Account Model	Each role connects own social accounts	Start simple — each user connects their own accounts. Cross-account posting comes later
Interaction Model	Donny-first, manual UI as fallback	Talk to Donny instead of clicking through menus — that's the whole point of DragonCandy
Rollout Strategy	Role-first (Restaurant → Creator → Brand → Cross-role)	Restaurants get value first. Each phase builds on what came before instead of starting over
Campaign Tie-in	Deep integration at every lifecycle stage	Social posting is woven into every stage of a campaign, not bolted on at the end
Cost Governance	Inherits Donny AI Cost Architecture (T0–T3 routing)	Uses the cost architecture to route each feature to the right model — cuts social AI cost in half

Platform Priorities by Role

Role	Primary Platforms	Secondary
Restaurant	Instagram, TikTok, Google Business Profile, Facebook	YouTube, Threads
Creator	Instagram, TikTok, YouTube, X	Threads, LinkedIn

Role	Primary Platforms	Secondary
Brand	Instagram, TikTok, LinkedIn, YouTube	Facebook, X

Platform Integration Architecture

The full stack from user interaction to social platform — showing how every layer communicates and what each layer is responsible for.

FIG 1 — FULL SYSTEM STACK FROM REACT FRONTEND TO 10 SOCIAL PLATFORMS

Design rule: No Outstand API calls ever originate from the frontend. All social platform interactions are proxied through Supabase Edge Functions. OAuth tokens are encrypted at rest with AES-256. The Outstand API key is a Supabase secret — never exposed to the browser.

Section 1: Restaurant Role — Social Media Strategy

"Run your restaurant's entire social media presence without leaving DragonCandy — or just tell Donny what to post."

For a restaurant operator, social media is non-negotiable — but managing it manually across Instagram, TikTok, Google Business, and Facebook is a daily time tax that pulls owners away from running their business. DragonCandy eliminates that tax. The restaurant connects accounts once, and Donny handles the rest.

Daily Social Management Workflow

FIG 2 — RESTAURANT DAILY SOCIAL MANAGEMENT WORKFLOW

Campaign-Integrated Workflow

When a creator's deliverable is approved within a campaign, the social hook fires automatically:

FIG 3 — CAMPAIGN CONTENT APPROVAL TRIGGERS SOCIAL POST FLOW

DragonDash Rush Posting

The campaign content approval prompt differentiates by cost and speed, creating a natural revenue acceleration moment tied to the content approval event:

Option	Tier	AI Work
"Post now to all platforms"	DragonDash Rush (\$25–50 surcharge)	T2/Sonnet — multi-platform simultaneous posting with AI-written platform-specific captions, optimized hashtags, cross-tagging
"Schedule for optimal times"	Standard (Starter+)	T1/Haiku — picks best time per platform, queues posts
"Post to one platform now"	Standard (Starter+)	T1/Haiku — single-platform post with caption

Option	Tier	AI Work
"Edit first" / "Skip"	Free (all tiers)	T0/No AI — no AI cost, no action cost

Key Restaurant Features

Feature	Description
Content Calendar	Visual weekly/monthly view of scheduled posts across all platforms. Drag-and-drop rescheduling. Campaign deliverables appear automatically when approved.
Social Analytics	Engagement, reach, follower growth, best posting times — all feeding into the ROI Dashboard you already have.
Engagement Hub	Unified inbox for comments and mentions across all connected platforms. Donny suggests replies; restaurant approves or edits before sending.
UGC Reposting	When creators tag the restaurant on their own channels, Donny detects the mention and offers to reshare to the restaurant's accounts in one tap.
Google Business Sync	Auto-post updates, photos, and daily specials to Google Business Profile — this is how people find restaurants on Google, the #1 discovery channel.
Donny Auto-Pilot	Growth+ tier: Donny generates and schedules a weekly content plan based on menu, upcoming events, and trending local topics — fully autonomous with a daily summary.

Section 2: Creator Role — Social Media Strategy

"Every deliverable you create on DragonCandy becomes content for your own channels too — Donny handles the cross-posting so you can focus on creating."

Creators on DragonCandy are already producing great content. This integration makes sure that work compounds — campaign content grows the creator's personal audience, that audience growth shows up on their DragonCandy profile, and stronger profiles mean more campaigns at higher rates. It's a flywheel.

The Creator Flywheel

FIG 4 — THE CREATOR GROWTH FLYWHEEL POWERED BY SOCIAL INTEGRATION

Campaign Content to Personal Brand Growth

FIG 5 — CREATOR CAMPAIGN CONTENT → PERSONAL BRAND GROWTH WORKFLOW

Key Creator Features

Feature	Description
Auto Cross-Post	When campaign content is approved, Donny offers to post a creator-branded version to their own channels with one tap — different caption, different hashtags, same media.
Portfolio Analytics	Real engagement data from connected accounts feeds into the creator's DragonCandy profile — verified, not self-reported. Restaurants and brands see live metrics, not screenshots.
Content Calendar	Schedule posts across personal channels. Campaign deadlines and personal social posts live in one unified calendar view — no double-booking or missed windows.
Donny Caption Writer	Donny rewrites campaign captions for the creator's personal voice — different tone, hashtags, and CTA for their audience vs. the restaurant's messaging.
Growth Insights	Donny analyzes which campaign content performed best on creator's own channels and recommends what types of campaigns to apply for next — data-driven career guidance.
Verified Creator Badge	Creators with connected and active social accounts earn a "Verified" badge on their profile, building trust with restaurants and brands browsing the creator marketplace.

Section 3: Brand Role — Social Media Strategy

"Sponsor a campaign and watch it go live across the restaurant's, creator's, AND your own channels — with real-time performance data flowing back to your dashboard."

Brands sponsoring campaigns on DragonCandy get a multiplier they can't get anywhere else: one investment, three content pipelines, and unified performance data across all of them. Donny handles the amplification; brands get the ROI report.

The Brand Multiplier Effect

FIG 6 — BRAND MULTIPLIER: ONE CAMPAIGN, THREE CONTENT PIPELINES, COMBINED REACH DASHBOARD

Sponsorship to Amplification to Measurement

FIG 7 — BRAND SPONSORSHIP LIFECYCLE FROM CONNECTION TO ROI REPORT

Key Brand Features

Feature	Description
Sponsorship Amplification	One-tap repost of sponsored campaign content to the brand's own channels with Donny-written sponsor copy — brand voice, required hashtags, and #ad disclosures applied automatically.
Cross-Party Analytics	See how sponsored content performed across ALL parties — restaurant, creator, AND brand accounts. Total reach, impressions, engagement rate, and cost-per-impression in one view.
Creator Vetting by Metrics	Browse creators with verified, real-time social metrics. Filter by engagement rate, audience size, platform strength, and content niche — no more guessing from follower screenshots.
Donny Sponsorship Intelligence	"Which campaigns should I sponsor next?" — Donny recommends based on past sponsorship ROI, trending content categories, audience overlap with brand's existing following, and seasonal factors.
Brand Guidelines Enforcement	Set brand voice, required hashtags, mandatory disclosures (#ad, #sponsored), and prohibited language. Donny auto-applies all guidelines when drafting or amplifying content.
Sponsorship ROI Reports	Donny generates per-sponsorship reports: cost-per-impression, engagement rate, audience demographics, and a clear "sponsor again?" recommendation based on performance against benchmarks.

Campaign Lifecycle with Social Hooks

Social media is woven into every stage of the campaign flow — not bolted on as an afterthought. Each lifecycle event is an opportunity to create content, build reach, and generate platform data. The content approval moment is the highest-leverage event: three parties post simultaneously.

→ Brand: Donny amplifies sponsored content to brand channels

Stage 5: CAMPAIGN COMPLETE
Payment released

Analytics Hook: Aggregate social performance
across all 3 parties → ROI Dashboard →
Donny generates campaign performance summary

FIG 8 — 5-STAGE CAMPAIGN LIFECYCLE WITH SOCIAL HOOKS AT EVERY EVENT

The Triple Social Hook at Stage 4 is the defining moment of the integration. In a single event, the platform simultaneously coordinates three separate social posting workflows — each customized for the party's voice, audience, and platform mix — and aggregates all resulting analytics into a unified view. This is the capability that no standalone social media tool can replicate.

Section 4: Donny AI — The Social Media Brain

Donny is the personal assistant that makes social media management feel effortless. Instead of navigating menus and filling out forms, you just tell Donny what to do — "post today's special to Instagram" — and he handles the rest. Behind the scenes, Donny uses 25 social media tools to post, schedule, analyze, reply, and manage accounts for any role.

Example Commands by Role

RESTAURANT COMMANDS

- "Donny, post our new salmon roll photo to Instagram and Google Business with today's lunch special pricing"
- "Donny, schedule a week of posts using the content from our last 3 campaigns"
- "Donny, what's our best performing post this month?"
- "Donny, reply to the Google reviews from this week — thank positive ones, address concerns professionally"

CREATOR COMMANDS

- "Donny, cross-post that approved reel to my TikTok and Instagram — use my voice, not the restaurant's"
- "Donny, what kind of campaign content gets me the most engagement on my channels?"
- "Donny, schedule my behind-the-scenes from the shoot for Thursday at 6pm on all platforms"
- "Donny, show me how my follower count has grown since I started on DragonCandy"

BRAND COMMANDS

- "Donny, amplify the Sakura Sushi campaign to our LinkedIn and Instagram with sponsor copy"
- "Donny, how did our last 5 sponsorships perform across all channels?"
- "Donny, which campaigns in the marketplace would reach an audience that overlaps with ours?"
- "Donny, generate a sponsorship ROI report for Q2 and post the highlights to our LinkedIn"

Donny Automation Levels

Users choose how much autonomy to give Donny — from on-demand assistance to fully autonomous daily publishing:

Level	Behavior	Available On	Action Cost
Manual	Donny suggests when asked. User writes captions, picks times, publishes through UI. Donny helps up to their free tier limit.	All tiers (including Free)	0 actions (T0)
Assisted (default)	Donny drafts captions and suggests times. User reviews before publish. Ideal balance of automation and control.	Starter+ (\$149/mo)	1–3 actions/post (T1)
Auto-Pilot	Donny generates a weekly content plan, schedules, and publishes autonomously. Sends a daily summary digest. User can override anytime.	Growth+ (\$499/mo)	10 actions/day flat (T2)

Section 5: How It's Built

Three rules govern the technical design: social API calls always go through our backend (never direct from the browser), login tokens are encrypted, and all new database tables follow the same security patterns we already use.

System Layers

FIG 10 — DETAILED SYSTEM LAYERS WITH COMPONENT BREAKDOWN

Design rule: No social API calls from the browser — everything goes through our backend. This keeps tokens secure, simplifies rate limiting, and matches the pattern we already use for Toast POS. Users see "DragonCandy Social" with no third-party branding.

Section 6: Implementation Phases

Four sequential phases, each building on the foundation established by the previous one. Phase 1 is the most investment-intensive — it creates the reusable infrastructure (Outstand API client, OAuth components, Donny MCP routing, content calendar, post composer, analytics layer) that Phases 2–4 configure rather than rebuild.

FIG 11 — IMPLEMENTATION GANTT CHART (INDICATIVE; EXACT DATES ADJUSTED AT SPRINT PLANNING)

1

Restaurant Social Media

~4–5 weeks

Goal: Full social media experience for restaurants. Establishes the reusable foundation for all later phases. Phase 1 is the highest-leverage investment — every component built here is reused or

configured in Phases 2–4.

Step	Deliverable	Type
1a	Build the connection to Outstand's API with secure token storage. This becomes the foundation everything else runs on.	Backend / Foundation
1b	Connect Donny to Outstand so he can post, schedule, and pull analytics through natural language commands.	AI / Foundation
1c	The settings page where restaurants connect their Instagram, TikTok, Google Business, and Facebook accounts.	Frontend
1d	Post composer and content calendar. Tell Donny what to post, or do it manually — either way, it goes to all your platforms.	Frontend + Backend
1e	Analytics dashboard and unified inbox for comments across all platforms. Feeds into the ROI Dashboard.	Frontend + Backend

Foundation work in Phase 1 reused by Phases 2–4: Outstand API Edge Function client, OAuth flow components, Donny MCP social tool routing, content calendar component, post composer component, analytics fetching and caching layer.

2

Creator Social Media

~3–4 weeks

Goal: Cross-posting, portfolio analytics, and personal brand growth tools for creators. Reuses Phase 1 OAuth and calendar components — new work is creator-specific UX and the caption rewriter.

Deliverable	Notes
Creator account connection	Same OAuth setup from Phase 1, configured for creator platforms (Instagram, TikTok, YouTube, X)
Cross-post on content approval	When content is approved, Donny prompts the creator to cross-post with one tap

Deliverable	Notes
Donny caption rewriter	Rewrites the restaurant's caption for the creator's voice and audience — cheap AI task
Creator content calendar	Same calendar from Phase 1, with campaign deadlines and personal posting timeline added
Portfolio analytics (verified)	Real metrics from connected accounts on the creator's profile — live data, not self-reported
Verified Creator badge	Earned by connecting accounts and hitting a minimum activity level. Shows on profile and in search results
Growth insights	Donny analyzes cross-post performance and recommends which campaign types to pursue next
Standalone posting	Creators can post their own non-campaign content through DragonCandy too (behind-the-scenes, portfolio highlights)

3 Brand Social Media

~3–4 weeks

Goal: Sponsorship amplification, cross-party analytics, and brand intelligence. Highest revenue impact phase — sponsorship amplification and ROI reporting are premium features that directly justify the Growth/Pro subscription tier.

Deliverable	Notes
Brand account connection	Same OAuth setup, configured for brand platforms (LinkedIn, Instagram, TikTok)
Sponsorship amplification	One-tap repost of sponsored content to the brand's channels with Donny-written copy and auto-applied brand guidelines
Brand guidelines enforcement	Set voice, required hashtags, mandatory disclosures; Donny reads guidelines from brand profile and applies automatically

Deliverable	Notes
Cross-party analytics	Aggregate performance across restaurant + creator + brand accounts per sponsorship — one unified view
Creator vetting by metrics	Enhance creator browse with verified real-time social metrics; filter by engagement rate, audience size, platform
Donny sponsorship intelligence	AI-powered recommendations for which campaigns to sponsor — T2/Sonnet cross-campaign pattern analysis
Sponsorship ROI reports	Per-sponsorship reports: cost-per-impression, reach, engagement rate, demographics, "sponsor again?" recommendation
Brand content calendar	Reuses Phase 1 calendar, adds sponsorship timeline integration and brand posting schedule

4

Cross-Role & Advanced

~3–4 weeks

Goal: Tie all three roles together at the campaign lifecycle level. Advanced automation features including Donny Auto-Pilot, UGC detection, and the Triple Social Hook at content approval. This phase delivers the full vision described in the executive summary.

Deliverable	Notes
Campaign social hooks (all 5 stages)	Social prompts at campaign creation, sponsorship, creator matching, content approval, and campaign completion
Triple-post on content approval	Simultaneous coordinated posting to restaurant, creator, and brand channels — the defining feature of the integration
Donny Auto-Pilot mode	Autonomous content generation, scheduling, and publishing with daily summary digest. Growth+ tier feature.
UGC detection & reposting	Donny detects when creators tag restaurants on their own channels; offers one-tap reshare to restaurant accounts

Deliverable	Notes
Unified cross-role analytics	Combined dashboard showing campaign social performance across all parties — the "265K combined reach" view
Donny weekly content planner	AI generates a full week of content based on menu, events, trends, and past performance data
Delegated posting architecture	Build the permission model for future cross-account posting — lays groundwork for Phase 2 of delegated access post-launch
Performance-based recommendations	Donny uses historical data to recommend optimal posting strategies per role, content type, and platform

Section 7: Market Context (2026)

This integration is designed for the market as it exists today — not 2022. The trends below directly informed platform prioritization, feature ordering, and the decision to go deep on short-form video and Google Business Profile before any other format.

Restaurant Trends

- **Instagram and Google Business Profile are non-negotiable.** Local discovery for restaurants now runs through these two platforms more than any other. A restaurant without an active GBP presence loses direct search traffic daily.
- **TikTok influence is disproportionate to follower count.** 61% of diners report TikTok food content directly influences where they eat — even one viral local food video reshapes a restaurant's booking curve.
- **Short-form video dominates all other formats.** Reels, TikToks, and YouTube Shorts generate 3–8x the organic reach of static image posts. Every campaign deliverable should be a video-first asset.
- **Staff-led content (EGC) is emerging.** Employee-generated content in hospitality is under-leveraged and showing strong performance — DragonCandy campaigns can seed this with creator-produced content that feels staff-originated.

Creator Economy Trends

- **\$20.6 billion in 2026** — creator economy revenue growing at 16.2% YoY. The market is not slowing.
- **Shift toward long-term brand partnerships.** One-off sponsorships are losing favor; creators and brands both prefer repeated campaigns with the same partners. DragonCandy's campaign repeat infrastructure supports this.
- **Micro-influencers with local community trust preferred.** For restaurants specifically, a 5,000-follower local food creator outperforms a 500,000-follower national influencer in drive-to-location conversions.
- **92% of consumers trust UGC over traditional advertising.** Creator-produced content that appears on both the restaurant's AND creator's channels maximizes the authenticity signal.

Brand Trends

- **Focus on 2–3 platforms done well.** The era of "be everywhere" is over for most brands. LinkedIn for B2B, Instagram and TikTok for consumer — the platform priority table in this spec reflects this.
- **AI-driven personalization is becoming foundational.** Brands that still write captions manually are already behind. Donny-powered content generation is not a differentiator — it's becoming table stakes.
- **Performance-driven influencer marketing.** Brands want measurable ROI, not just impressions. The sponsorship ROI report feature directly addresses this shift — real data, not estimated reach.
- **Authenticity over polish, especially Gen Z and Millennials.** Creator-produced restaurant content outperforms brand-produced studio content on every engagement metric. The DragonCandy model is structurally aligned with where consumer trust lives.

Section 8: Cost Governance Integration

The social integration uses the same cost rules as all of Donny — defined in the **Donny AI Cost Architecture** document. The routing decisions below aren't suggestions. They're the rules every social media AI call follows.

Cost impact summary: 6 of 15 social media features route to T1/Haiku, 6 route to T2/Sonnet, and 3 require no AI at all (T0). Versus routing all 15 to Sonnet, this cuts social media AI cost roughly in half while preserving quality where it matters.

Model Tier Assignments — Social Media Features

Social Media Feature	Model Tier	Rationale
Caption & hashtag generation	T1 / Haiku	Pattern matching — templates + trending data. High volume, low complexity.
Engagement hub reply drafting	T1 / Haiku	Short-form templated responses. Character-limited output.
Content calendar slot suggestions	T1 / Haiku	Time-slot optimization from engagement data. Structured input/output.
UGC detection & reshare prompts	T1 / Haiku	Tag/mention detection + templated prompt generation.
Google Business sync posts	T1 / Haiku	Format adaptation for GBP's specific field requirements.
Cross-post caption rewriting	T1 / Haiku	Voice/tone adaptation — pattern matching with creator's prior captions as examples.

Social Media Feature	Model Tier	Rationale
Growth insights & recommendations	T2 / Sonnet	Multi-signal analysis across platforms, time periods, and content types.
Multi-platform simultaneous posting	T2 / Sonnet	Complex orchestration across platform APIs with platform-specific caption variants.
Brand guidelines enforcement	T2 / Sonnet	Content review against multiple constraints — voice, hashtags, disclosures, prohibitions.
Sponsorship ROI report generation	T2 / Sonnet	Multi-party analytics synthesis across restaurant, creator, and brand data.
Auto-Pilot weekly content planner	T2 / Sonnet	Multi-day content strategy generation with trend analysis and calendar optimization.
Sponsorship intelligence recommendations	T2 / Sonnet	Cross-campaign pattern analysis and audience overlap calculation.
Scheduled post dispatch	T0 / No AI	Already-written content, just API call. No generation needed.
Analytics fetching from Outstand	T0 / No AI	Data retrieval and caching. No generation or reasoning.
Account connection OAuth flow	T0 / No AI	Authentication state machine. No AI involved.

Automation Levels Tied to Subscription Tiers

Automation Level	Available On	Action Cost	Behavior
Manual	All tiers (including Free)	0 actions (T0/UI)	User writes captions, picks times, publishes through UI. Donny available for on-demand requests up to 50-action monthly limit.

Automation Level	Available On	Action Cost	Behavior
Assisted (default)	Starter+ (\$149/mo)	1–3 actions/post (T1)	Donny drafts captions and suggests optimal times. User reviews before publish. Best balance of automation and control.
Auto-Pilot	Growth+ (\$499/mo)	10 actions/day flat (T2)	Donny generates weekly content plan, schedules, and publishes autonomously. Sends daily summary. User can override anytime.

Revenue cap rule: AI spend hard-capped at 15% of revenue (\$250/mo floor pre-revenue). DragonDash Rush Posting actions (T2/Sonnet, \$25–50 surcharge) generate revenue that more than covers their AI cost — the high-cost features are self-funding by design.

Section 9: Success Metrics

How we know this integration is working — measurable targets with explicit data sources. All metrics are grounded in existing Supabase infrastructure or Outstand API data that flows into the analytics cache.

60%

Social accounts connected within 30 days of Phase 1 launch

70%

Social actions initiated through Donny vs. manual UI

80%

Reduction in time from content approval to social publish

Metric	Target	Measured By
Social accounts connected per role	60% of active users connect at least 1 account within 30 days of their role's phase launch	Supabase <code>social_connections</code> table — connection timestamps vs. user activation dates
Posts published through DragonCandy	500+ posts/month within 60 days of Phase 1 launch	Outstand API analytics + <code>social_posts</code> table count
Campaign content cross-posted (creators)	40% of approved deliverables cross-posted by creators within 48 hours	Cross-post prompt acceptance rate tracked in <code>analytics_events</code>
Donny social command usage	70% of social actions initiated through Donny vs. manual UI	<code>analytics_events</code> — source: 'donny' vs. source: 'manual' on post create events
Brand amplification rate	50% of sponsored content amplified to brand's channels within 24 hours of creator approval	Sponsorship amplification events in <code>social_posts</code> linked to <code>campaign_sponsorships</code>

Metric	Target	Measured By
Time-to-post reduction	80% reduction in time from content approval to social publish vs. manual workflow	Timestamp delta: campaign_applications.approved_at → social_posts.published_at
Creator profile engagement lift	25% increase in campaign application invite rate for verified creators vs. unverified	Compare campaign_invitations rate for profiles with verified_creator: true vs. false
Outstand cost efficiency	Social platform integration cost stays below 5% of revenue from social-enabled subscriptions	Outstand invoice vs. MRR from Starter+ and above subscriptions

Section 10: Guiding Principles

Six principles that govern every implementation decision in this integration. When a technical choice is unclear, run it through these principles. The principles are ordered by priority — conflicts resolve by applying the higher-ranked principle.

1. Donny First, UI Second

Every social action must be achievable through Donny. The manual UI is the fallback, not the primary path. If you're building a UI for a social action, simultaneously ask: what's the Donny command for this?

2. Never Store Secrets Client-Side

Outstand API keys and OAuth tokens live in Supabase with AES-256 encryption. Edge Functions proxy all calls. No exceptions — this is a security requirement, not a preference.

3. White-Label Everything

Users see "DragonCandy Social" — never "Powered by Outstand." No third-party branding surfaces anywhere in the product. The integration is invisible infrastructure.

4. Build for Reuse

Phase 1 components (OAuth, posting, analytics) are role-agnostic. Phases 2–3 configure, not rebuild. Any new component should ask: can this be parameterized to work for all three roles?

5. Respect Existing Patterns

Follow the Toast POS integration pattern for OAuth token storage and Edge Function proxy design. Follow existing RLS patterns for all new tables. Consistency reduces the surface area for bugs.

6. RLS on Everything

All new social tables (`social_connections` , `social_posts` , `social_post_analytics`) follow existing Row Level Security patterns. Users can only access their own social data — no cross-tenant leakage.

Musk's Algorithm applied to this integration:

- **Deleted:** Manual download-and-post workflow. Separate analytics dashboards per platform. Self-reported creator metrics.

- **Simplified:** One API (Outstand) replaces 10 platform integrations. One Donny command replaces navigating 4 separate apps.
- **Accelerated:** Content approval to social publish drops from ~20 minutes to <60 seconds.
- **Automated:** Triple Social Hook fires automatically on content approval. Analytics cache refreshes on a schedule. Creator badge updates on account activity.

Appendices — Developer Reference

The sections below are for the dev team. They contain architecture details, API references, database schemas, and Outstand pricing. If you're reading this as a stakeholder, you can stop here — the main document covered everything you need.

Appendix A: Donny AI Social Architecture

DONNY AI → OUTSTAND MCP → 10 PLATFORM ARCHITECTURE

DONNY CAPABILITIES VIA OUTSTAND MCP

Category	What Donny Can Do
Create	Write captions, select hashtags, format per platform requirements (character limits, aspect ratios, tag formats)
Schedule	Pick optimal posting times based on engagement analytics per platform, queue content for future publish
Publish	Post to multiple platforms simultaneously in one action; handle media upload, confirmation, and status tracking

Category	What Donny Can Do
Analyze	Pull engagement stats, track follower growth, identify trending content, compare performance across parties
Engage	Read comments and mentions, draft replies in the account's voice, detect UGC tags, surface for approval
Manage	Upload media files, list connected accounts, initiate OAuth connections, disconnect accounts on request

Appendix B: Technical Architecture Reference

KEY TECHNICAL DECISIONS

Decision	Detail
API Proxy	All Outstand API calls go through Supabase Edge Functions. The client never touches the Outstand API directly — same pattern as the existing Toast POS integration.
Token Storage	OAuth tokens encrypted with AES-256 in Supabase, following the existing <code>toast_connections</code> table pattern. Service role only — RLS prevents user access to raw tokens.
Outstand Auth	Bearer token API key stored as a Supabase secret via <code>supabase secrets set</code> — never exposed to the frontend or committed to the repo.
Social Account Linking	New <code>social_connections</code> table linking <code>profile_id</code> to Outstand's <code>social_account_id</code> per platform.
Post Records	New <code>social_posts</code> table tracking all posts. Enables dashboard rendering without live Outstand calls.
Analytics Caching	Pull analytics from Outstand periodically (hourly for recent posts, daily for historical). Cache in Supabase for fast dashboard rendering.

Decision	Detail
White-Label	Outstand's white-label mode enabled. Users see "DragonCandy Social" — no third-party branding anywhere.
BYOK Architecture	Schema supports Bring Your Own Keys: <code>social_connections</code> includes a nullable <code>custom_app_credentials</code> column for power users post-launch.

OUTSTAND.SO API REFERENCE

Endpoint	Purpose
POST <code>/v1/posts</code>	Create and optionally schedule a post
GET <code>/v1/posts</code>	List posts with status and platform filtering
GET <code>/v1/posts/{id}</code>	Get post details and per-post analytics
DELETE <code>/v1/posts/{id}</code>	Delete or cancel a scheduled post
POST <code>/v1/posts/{id}/comments</code>	Publish a reply to a comment
GET <code>/v1/posts/{id}/comments</code>	Retrieve comments for unified inbox
POST <code>/v1/media</code>	Get presigned upload URL for media
POST <code>/v1/media/{id}/confirm</code>	Confirm upload completion
GET <code>/v1/social-accounts</code>	List connected social accounts
GET <code>/v1/social-accounts/{id}/metrics</code>	Get account-level metrics
POST <code>/v1/social-networks</code>	Initiate OAuth connection
DELETE <code>/v1/social-networks/{id}</code>	Disconnect and revoke account

OUTSTAND PRICING (COST PLANNING)

Component	Cost	Notes
Base fee	\$5/month	Includes 1,000 posts — covers pre-revenue phase
Per-post overage	\$0.01/post	5,000 posts/mo → \$45/mo overage at scale
Per connected account	\$0.50/month	4 accounts per restaurant = \$2/mo
Volume discount	At 500K+ posts	Negotiate when revenue justifies

Appendix C: Database Schema

Table	Purpose	Key Columns
social_connections	Links user profiles to Outstand social account IDs per platform	profile_id , platform , outstand_account_id , encrypted_tokens , connected_at
social_posts	Tracks all posts created through DragonCandy	outstand_post_id , profile_id , platform , status , scheduled_at , published_at , campaign_id
social_post_analytics	Cached analytics data per post (refreshed periodically)	post_id , impressions , reach , engagement_rate , likes , comments , pulled_at
